

CROSSLINK

TROUBLESHOOTING
GUIDE

Update Package Lists

Before installing new software, it's always a good idea to update your package lists to ensure you're getting the latest versions:

```
sudo apt update
```

Wine is not found or not properly installed

Make sure Wine is installed on your system. You can usually install it with:

```
sudo apt install wine64 wine32
```

Then run `winecfg` once to complete the setup.

Winetricks is not installed

CrossLink requires `wine-tricks` to install Windows dependencies. Install it using your package manager:

```
sudo apt install winetricks
```

No output or empty logs when running .exe

Check that the executable is valid and compatible with Wine. Some applications require additional components (e.g. .NET, DirectX).

Try installing common dependencies using the **Install Dependencies** section in CrossLink.

Issues with creating or selecting bottles

Bottles are stored in `~/ .local/share/crosslink_bottles`. If bottle creation fails:

- Ensure you have write permission to that directory
- Make sure `winecfg` can run in your environment
- Try restarting CrossLink and creating a new bottle

Other errors or crashes

Watch the activity log for specific error messages. These often indicate missing packages, Wine misconfiguration, or broken .exe files.
